Main 

Objectives ▼

- **Describe** motion in terms of frame of reference, displacement, time, and velocity. ▼
- **Calculate** the displacement of an object traveling at a known velocity for a specific time interval. ▼
- **Construct** and **interpret** graphs of position versus time.

Main 

One Dimensional Motion ▼

- To simplify the concept of motion, we will first consider motion that takes place in **one direction.** ▼
- One example is the motion of a commuter train on a straight track. ▼
- To measure motion, you must choose a **frame of reference.** A frame of reference is a system for specifying the precise location of objects in space and time.

Chapter 2

Section 1 Displacement and Velocity

Displacement ▼

- **Displacement** is a **change in position.** ▼
- Displacement is not always equal to the distance traveled. ▼
- The SI unit of displacement is the **meter, m.** ▼

$$\Delta x = x_f - x_i$$

displacement = final position – initial position

Average Velocity ▼

- **Average velocity** is the total **displacement** divided by the **time interval** during which the displacement occurred. ▼

$$v_{avg} = \frac{\Delta x}{\Delta t} = \frac{x_f - x_i}{t_f - t_i}$$

$$\text{average velocity} = \frac{\text{change in position}}{\text{change in time}} = \frac{\text{displacement}}{\text{time interval}} ▼$$

- In SI, the unit of velocity is **meters per second**, abbreviated as **m/s**.

Velocity and Speed ▼

- **Velocity** describes motion with both a **direction** and a **numerical value** (a magnitude). ▼
- **Speed** has no direction, only magnitude. ▼
- **Average speed** is equal to the total **distance traveled** divided by the **time interval**.

$$\text{average speed} = \frac{\text{distance traveled}}{\text{time of travel}}$$

Main

Interpreting Velocity Graphically

- For any **position-time graph**, we can determine the **average velocity** by drawing a straight line between any two points on the graph.
- If the velocity is **constant**, the graph of position versus time is a **straight line**. The slope indicates the velocity.
 - **Object 1:** positive slope = positive velocity
 - **Object 2:** zero slope = zero velocity
 - **Object 3:** negative slope = negative velocity

Chapter 2

Section 1 Displacement and Velocity

Interpreting Velocity Graphically, *continued* ▼

The **instantaneous velocity** is the velocity of an object at some instant or at a specific point in the object's path. ▼

The instantaneous velocity at a given time can be determined by measuring the slope of the line that is tangent to that point on the position-versus-time graph.
