Objectives ▼

- **Distinguish** between a scalar and a vector. ▼
- **Add** and **subtract** vectors by using the graphical method. ▼
- **Multiply** and **divide** vectors by scalars.

Scalars and Vectors ▾

- A **scalar** is a physical quantity that has magnitude but no direction.
 - **Examples:** speed, volume, the number of pages in your textbook ▾
- A **vector** is a physical quantity that has both magnitude and direction.
 - **Examples:** displacement, velocity, acceleration ▾
- In this book, scalar quantities are in *italics*. Vectors are represented by **boldface** symbols.

Graphical Addition of Vectors

- A **resultant vector** represents the sum of two or more vectors.
- Vectors can be added **graphically**.

A student walks from his house to his friend's house (a), then from his friend's house to the school (b). The student's resultant displacement (c) can be found by using a ruler and a protractor.

Triangle Method of Addition ▼

- Vectors can be moved **parallel** to themselves in a diagram. ▼
- Thus, you can draw one vector with its **tail** starting at the **tip** of the other as long as the size and direction of each vector do not change. ▼
- The **resultant vector** can then be drawn from the tail of the first vector to the tip of the last vector.

Properties of Vectors

- Vectors can be added in **any order**.
- To **subtract** a vector, add its opposite.
- **Multiplying** or **dividing** vectors by scalars results in vectors.
